M.A.N.T.T.[®] *Crystaltex*

Our **Lateral Panels Crystaltex** are made of a powder coated aluminum frame and highly resistant transparent PVC (Crystal).

We have conceived a modular system of panels very easy to install and remove. The panels slide into one another by means of patented profiles. They are extremely light (**less than 3 kg each**). The panels are independent from the upper covering and independent one from another; this means that you can decide which side to leave open or closed according to your needs. Some can be sliding. Being totally removable, they are not considered as a permanent structure.

Our Lateral Panels protect from smog, dust and atmospheric agents in general, creating a healthy environment for your restaurant. They were also tested during the Hurricane Florence that swept Bermuda in September 2006, when they resisted winds up to 100 km/h. With all these features, we feel sure we can provide you with what you require for your space.

Elegance, style and practicality distinguish this protection system among the many similar products on the market.

Crystaltex Lateral Panels is a completely dismantlable lateral protection system, resistant to winds **up to 115 km/h and over**. It offers protection from smog and air pollution, provides urban decoration and it's quick and easy to install and remove.

The Crystaltex Lateral Panels **comply with all US and European regulations**, Fire Marshall included. No need to place sliding rails in the grounds. (are required)

Therefore, Crystaltex ensures easy access for impaired people and constitutes no danger for children. For these reasons, many towns approve our lateral protection system and include it in their building codes.
